

Player Analytics and Metrics — Game Title

Fictional demo document for Studio Agent Nexus. Synthetic content, safe for public demonstration. Defines the player-facing metrics tracked for Game Title: analytics funnels, authentication, retention, and monetization/ads.

1. Purpose

This document defines how Game Studio measures player behaviour for Game Title and how those metrics are computed from the event pipeline. It is the reference for the analytics and monetization dashboards.

2. Core engagement metrics

- DAU / MAU: distinct players with at least one session in the day / month.
- Sessions per player and average session length.
- Concurrency: peak and average concurrent players, by region.

3. Authentication and login funnel

The login funnel measures conversion from launch to authenticated session: launch → account selection → credential validation → session established. Drop-off at each step is tracked from `auth_events`. Cross-play identity linking is measured as the share of accounts with more than one linked platform.

4. Retention

Retention measures whether players return after install. D1 retention counts a player as retained if they return within 24 hours of install — a rolling 24-hour window from the install timestamp. D7 and D30 follow the same rolling definition from install.

Note: this rolling-window definition differs from the calendar-day bucketing described in the Data Pipeline Spec, and the two must be reconciled so dashboards agree.

5. Monetization and ads

Monetization combines in-app purchases (IAP) and rewarded/interstitial ads.

- ARPU and ARPPU across IAP and ad revenue.
- IAP conversion: share of players making at least one purchase.
- Ad metrics: impressions, fill rate, eCPM, and ad ARPU.

Open gap: ad revenue metrics depend on a player consent flag that is not yet wired through the client SDK. Until the consent signal is captured and joined to `ad_events`, ad fill rate and ad ARPU are under-reported and the data cannot be considered privacy-compliant for regions that require consent.

6. Dashboards

- Engagement: DAU/MAU, sessions, concurrency.
- Acquisition & auth: install-to-session funnel, link rate.
- Retention: D1/D7/D30 cohorts.
- Monetization: IAP, ads, ARPU — populating live events is a beta criterion.

7. Ownership

Analytics and metrics are owned by the Data team (see the Team Directory). Pipeline questions route to the event-pipeline owner; metric-definition questions route to the analytics owner.
